

Olinethra Website — Design Brief for Interns

Oct 4, 2026 · @Olinethra

The idea

Olinethra is a marketing website for a software engineering and AI consultancy. It should feel like looking at a live production system, not a brochure. Every page borrows the look of developer tools: API endpoints as section labels, terminal windows, uptime numbers and status lights.

Who it is for: CTOs, VPs of Engineering and platform leads at mid-size and enterprise companies. They are technical, skeptical of sales talk, and want proof.

What a visitor should feel: "These people build serious systems, and they talk to me like an engineer."

What a visitor should do: book a consultation with an architect, or send a project brief. Every page ends by pushing toward one of those two actions.

Three ideas run through the whole design:

- **The site is the API.** Sections are labelled like endpoints (`GET /api/v1/services` , `POST /api/v1/inquiries`). The brand promise is shown through the interface itself.
- **Proof over adjectives.** Each claim carries a number: latency, uptime, throughput, cost saved.
- **No sales gatekeepers.** Copy repeats that you talk directly to a principal architect, never an account manager.

Site map

The site has four pages, and every path ends at Contact, where a visitor books a call or sends a brief.

Every page leads the visitor to the Contact page

Amber outline: Services exists, but no nav link reaches it yet

site map · 4 pages, 1 goal

Home sends visitors to Services and Projects, both of which close with a call to action that opens Contact. The orange header button is a shortcut to Contact from anywhere.

Page by page

Each page follows the same rhythm: a hero with a big claim, sections of proof, then a call to action. Sections are listed top to bottom in the order they appear.

1. Home (`index.html` , same as `code.html`)

Job: win attention in 5 seconds and send the visitor to Services, Projects or a booking.

1. **Hero** — headline "Engineering Scalable Software & Intelligent Cloud Systems for Ambitious Brands", two buttons (Explore Services, View Case Studies) and three proof badges (SOC-2, <250ms P99, 40+ nodes).
2. **Live terminal** — a fake console with two tabs (`/health` , `/services`) showing JSON and a latency sparkline. This is the signature visual.
3. **Metrics strip** — four big numbers: 99.99% SLA, <250ms, 40+ deployments, SOC-2.
4. **Tech stack chips** — Next.js, TypeScript, Rust, Go, Python, Kubernetes.
5. **Four service cards** — Web & Next.js, Cloud & DevOps, Applied AI, APIs & Distributed Systems. Each has tags and one benchmark.
6. **Three case study cards** — FinScale, Aether Health, Nexus Logistics, each with two metrics and tech badges.
7. **Testimonials** — three five-star quotes from engineering leaders.
8. **Call to action** — "Book Principal Discovery" and "Request System Audit".
9. **AI chat drawer** — a floating assistant opened from the bottom-right button.

2. Services (`code3.html`)

Job: explain what we do in depth and help a buyer size a project.

1. **Header** — "End-to-End Engineering & Modern Software Capabilities" with a cluster status card (14 regions, 99.995%).
2. **Four pillar cards with filter tabs** — Frontend, Cloud, AI, SRE. Each card lists four capabilities and three deliverables.
3. **Production flow diagram** — Edge Next.js → Go core → RAG → Zero-Trust SLA, plus four feature tiles.
4. **Delivery lifecycle** — four phases: Discovery (sprints 1-2), Blueprint (sprint 3), Bi-weekly shipments (sprints 4-12), Launch and SLA.
5. **Scope estimator** — pick architecture type, sprint count and security tier; the card on the right updates team, launch sprint and SLA.
6. **Call to action banner**.

3. Projects (`code2.html`)

Job: prove we have done this before.

1. **Header** with three summary metrics (148 microservices, 14.2ms, \$1.8B+).
2. **Filter pills and live search** across six categories.
3. **Six case study cards** — FinScale Treasury, Aether Telehealth, OmniRoute, Synthetix Data Cloud, PulseVibe, Novus Retail. Each card shows client, challenge, two KPIs and stack.
4. **Empty state** when no card matches.
5. **Cumulative metrics** — availability, response time, cloud savings, zero critical defects.
6. **Developer API banner** with a sample `curl` call.
7. **Architecture modal** — "Inspect Architecture" opens a detail panel styled like an API response.

4. Contact (`code4.html`)

Job: turn interest into a lead.

1. **Header** — "Let's Build Something Exceptional Together".
2. **Left column** — WhatsApp direct line, uptime card, SLA promise (NDA in 24 hours), two email inboxes, three office hubs with image.
3. **Right column** — the project brief form: name, email, company, website, scope, budget, timeline, specs, file upload.
4. **Pre-brief AI agent** — an inline chat demo with suggested questions.

Design system

The look is light, clean and technical: soft blue-white surfaces, one strong blue, and orange only for calls to action. All tokens live in the `tailwind.config` block at the top of every page and follow Material 3 naming.

Colors

Token	Hex	Use it for
<code>primary</code>	<code>#004fcb</code>	Links, active nav, icons, main buttons
<code>primary-container</code>	<code>#0265ff</code>	Hover states, chat button, highlights
<code>secondary-container</code>	<code>#fe6a17</code>	Orange call-to-action buttons and live status dots only
<code>tertiary</code>	<code>#006178</code>	Small technical labels and eyebrow text
<code>background</code> / <code>surface</code>	<code>#faf8ff</code>	Page background
<code>surface-container-lowest</code>	<code>#ffffff</code>	Cards
<code>surface-container-low</code>	<code>#f2f3ff</code>	Alternate section bands, inner panels
<code>surface-container-high</code>	<code>#e5e7f6</code>	Darker bands, progress tracks
<code>on-surface</code>	<code>#171b26</code>	Headings and main text
<code>on-surface-variant</code>	<code>#424656</code>	Body and secondary text
<code>outline-variant</code>	<code>#c2c6d8</code>	Dividers and separators

Rule of thumb: blue means "information", orange means "act now". Never use orange for decoration.

Typography

Style	Font	Size / line height	Use
<code>display-hero</code>	Plus Jakarta Sans 800	64 / 72px (40 / 48 mobile)	Home hero only
<code>headline-xl</code>	Plus Jakarta Sans 700	48 / 56px	Page titles

Style	Font	Size / line height	Use
headline-lg	Plus Jakarta Sans 700	32 / 40px	Section titles
headline-md	Plus Jakarta Sans 600	24 / 32px	Card titles
headline-sm	Plus Jakarta Sans 600	20 / 28px	Small titles, logo
body-lg	Inter 400	18 / 28px	Hero subtext
body-md	Inter 400	16 / 24px	Default text
body-sm	Inter 400	14 / 20px	Card text, lists
label-md	Inter 600	14 / 20px	Buttons, nav
code-sm	Inter 500	13 / 18px	Endpoint labels, metrics, badges

Spacing and shape

- Spacing scale: space-xs 4px, space-sm 8px, space-md 16px, space-lg 24px, space-xl 40px, space-2xl 64px.
- Page side margin: 20px mobile, 32px tablet, 48px desktop. Content max width is max-w-7xl (1280px).
- Corners: 4px default, 8px for buttons and inputs, 12px for cards, full round for pills.
- No visible borders. Separation comes from background shifts and soft shadows (shadow-sm , hover shadow-md).

Icons and recurring components

- Icons: Google Material Symbols Outlined (terminal , verified , hub , psychology , shield , bolt).
- **Header:** fixed, 80px tall, frosted glass (bg-surface/80 backdrop-blur-xl), logo + "API Operational" pill + nav + orange "Schedule Consultation" button.
- **Eyebrow label:** small uppercase code-sm text with an icon or pulsing dot above each section title.
- **Card:** white, 12px corners, 24px padding, icon tile top-left, code-style tag top-right.
- **Metric tile:** big number + small label, often in a strip of four.
- **Tech badge:** small grey pill with a stack name.
- **Floating AI button:** bottom-right, blue pill, on every page.

- **Footer:** logo + tagline, Solutions list, Navigation, newsletter signup.

Interactive behaviors

All interactions today are front-end simulations in plain JavaScript. Nothing is sent to a server yet; each one needs a real backend before launch.

Page	Feature	What it does now	What it needs for real
Home	Terminal tabs (<code>switchTerminalTab</code>)	Swaps the JSON shown for <code>/health</code> vs <code>/services</code>	Optional: real status data
Home	AI chat drawer (<code>toggleAIChat</code> , <code>sendQuickPrompt</code>)	Opens a panel; quick prompts give canned replies	An LLM-backed chat endpoint
Services	Pillar filter tabs (<code>filterPillars</code>)	Shows one of the four pillar cards, or all	Nothing — complete
Services	Scope estimator (<code>calculateEstimates</code>)	Updates sprints, team pod, launch sprint, SLA and security label	Agree real pricing rules; pass the chosen scope into the contact form
Projects	Category pills + search (<code>applyFilters</code>)	Filters six cards; shows "N shown" and an empty state	Load projects from a CMS or JSON file
Projects	Architecture modal	Opens a detail panel filled from the card	Real write-ups per project
Contact	Budget selector (<code>selectBudget</code>)	Highlights a tier and updates the hint text	Nothing — complete
Contact	Project brief form (<code>handleInquirySubmission</code>)	Shows a spinner, then a fake "#INQ-9482" success message	Send to email / CRM, validate, store uploads
Contact	File upload	Shows the chosen file name	Real upload with size and type checks

Page	Feature	What it does now	What it needs for real
Contact	Pre-brief AI agent (<code>handleChatInput</code>)	Echoes the question with a generic reply	Same chat endpoint as Home
All	Floating "AI Agent" button	Visual only on Services and Contact	Wire to the shared chat drawer

Content and voice

Write like a senior engineer talking to another engineer: confident, specific, short. When in doubt, swap an adjective for a number.

- **Do:** "<60s automated recovery", "NDA signed within 24 business hours", "Talk directly to an architect."
- **Don't:** "world-class", "cutting-edge", "synergy", or claims with no figure behind them.
- Use endpoint-style eyebrow labels (`GET /api/v1/...`) for section headers, but keep the headline itself in plain English.
- Every section ends with a clear next step.

Placeholder content to replace before launch

All names, numbers and clients in the mockups are sample content. Nothing should go live until it is replaced with real, verifiable information.

- **Case studies and clients:** FinScale, Aether, Nexus / OmniRoute, Synthetix, PulseVibe, Novus are invented.
- **Testimonials:** Marcus Reynolds, Elena Vargas and Siddharth Kumar are invented people. Use real quotes with permission only.
- **Metrics:** 99.999% uptime, \$1.8B+ processed, 148 microservices, SOC-2 / HIPAA claims. Only publish figures and certifications we actually hold.
- **Contact details:** phone +1 415 555 0192, the San Francisco / London / Singapore addresses, and the two email inboxes.
- **Form demo values:** "Dr. Elena Vance" placeholder and the #INQ-9482 success ID.
- **Copyright:** footer says © 2025; update to the current year.

Intern tasks and next steps

The mockups are static HTML with Tailwind from a CDN. The goal is to rebuild them as a Next.js app in this repo (`portfolio_Nalini`) with shared components. Read `AGENTS.md` first: the repo uses a newer Next.js with breaking changes, so check `node_modules/next/dist/docs/` before writing code.

Fix first

- ☐ Merge `index.html` and `code.html` — they are the same page (only quote marks differ).
- ☐ Make the Services page reachable. Today every nav link for "Services" goes to Home; nothing links to `code3.html` .
- ☐ Make the nav the same on every page. Services shows 7 links (Team, Insights, Careers, FAQs included); the others show 3. Team, Insights, Careers and FAQs have no pages yet.
- ☐ Point "Client Portal", "Privacy", "Service SLA" and "API Telemetry" at real pages or remove them.

Build in Next.js

1. Move the Tailwind tokens into the project's Tailwind config so every page shares them.
2. Build shared components: Header, Footer, AI chat button and drawer, Card, Metric tile, Tech badge, Eyebrow label.
3. Build the four pages as routes: `/` , `/services` , `/projects` , `/contact` .
4. Move case studies, services and testimonials into data files so cards render from one source.
5. Rebuild each interaction from the table above as a client component.
6. Connect the contact form to a real endpoint and pass the estimator's scope into it.
7. Check mobile layouts at 375px and keyboard and screen reader access.

Open questions for the founder

- Which case studies, metrics and certifications are real and approved to publish?
- Should the AI chat be a real assistant at launch, or hidden until ready?
- Are Team, Insights, Careers and FAQs in scope for version 1?
